PROJECT REPORT

Task 1 Create a Digital Literacy Awareness Infographic

I created my infographic using Canva, as it offers a wide range of free templates, icons, and

design tools that make it easy to create visually appealing content. My design focuses on key

aspects of digital literacy, including what digital literacy is, useful digital tools for students, safe internet practices, professional online presence, and email etiquette. In the center, I highlighted “Digital Literacy” as the main concept, with connected sections explaining each topic clearly using short and simple points.

The infographic explains digital literacy as the ability to use digital devices and the internet

effectively and safely. It also lists useful tools like Google Docs, Zoom, Notion, and Khan

Academy that help students in learning and collaboration. Additionally, it emphasizes safe

internet practices, maintaining a professional online presence, and proper email etiquette such as using polite language and clear subject lines.

While creating the design, I focused on keeping it neat, readable, and visually balanced by using icons, arrows, and a consistent color theme. One thing I found challenging was arranging all the information without making the layout look crowded. However, I found it interesting to experiment with different design elements and improve my creativity.

Task 2 Build Your Student Digital Portfolio

For this task, I created and updated my accounts on GitHub, LinkedIn, and Kaggle. Each of these platforms serves a different purpose and is useful for building a strong professional and academic presence. GitHub is mainly used for sharing and managing code, where I created a profile README including my name, branch, year, and my learning goals. LinkedIn is a professional networking platform where I added my education details, including my current degree, institution, and expected graduation year. Kaggle is a platform for data science and machine learning, where users can practice problems, participate in competitions, and learn from datasets.

Over the next four years, I plan to actively use GitHub to upload my projects, improve my coding skills, and showcase my work to potential recruiters. On LinkedIn, I will build my professional network, connect with industry experts, and stay updated with career opportunities. On Kaggle, I aim to develop my analytical and problem-solving skills by participating in competitions and working on real-world datasets. Overall, these platforms will help me grow academically and professionally while preparing me for future career opportunities.

Task 3 Explore Coding & Collaboration Platforms

For this task I used HackerRank and Google Forms. On HackerRank, I tried one beginner question (the basic one at the start). It was simple, but it helped me understand how the platform works. Like how to write the code, run it, and check if it passes all the test cases. At first I made a small mistake in the output, so I had to fix it and run again.

For the second part, I made a Google Form with 5 questions related to digital literacy. I added both MCQ and one short answer question. After that I checked the responses in Google Sheets. It was actually useful because all the answers get stored automatically and you don’t have to do anything manually.

These tools are helpful for studies. HackerRank is good for practice, especially if you are learning coding step by step. Google Forms is useful for collecting

responses and working in groups. I'll probably use both again for assignments or practice.

Task 4 Draft a Professional Email & Etiquette Guide

One situation I can think of is when a student sends a message to a professor but doesn't really explain things properly. Like sometimes people just write something very short like "I need help" or "send marks" without any subject or proper details. From the student side it might feel normal, but from the professor's side it can be confusing or even sound a bit rude. So either they don't reply quickly or they ask again what the student actually meant, which just wastes time.

Something similar happens on social media also. People post or comment quickly without thinking much, and then others misunderstand it. Even a normal sentence can sound different depending on how someone reads it, and then arguments start for no real reason.

I think this can be avoided if we just slow down a bit before sending anything. Like just adding a proper line explaining what we want, and checking if it sounds okay. It's not a big thing but it actually makes communication much easier.

Task 5 Cybercrime Awareness Case Study & Prevention Guide

1. Introduction

Nowadays, most of our work as students happens online. We use the internet for classes, assignments, chatting, and even payments. It makes things easier, but at the same time, it also brings some risks.

One of the common issues is phishing. I had heard about it before, but didn't really know how it actually works. After looking into it, I realized it's more common than I thought. In this report, I've explained it in a simple way and also added some basic precautions that can help.

---

2. Case Study: Phishing Attack

Phishing is when someone tries to trick you into giving your personal information, like passwords or bank details. The main thing is that it doesn't look fake at first.

For example, a student might get an email that looks like it's from their college or bank. It may say there is some issue with the account and it needs to be fixed quickly. Because of that, people don't think much and just click the link. The link opens a page that looks almost the same as the real website. So it feels normal to enter details there, but actually those details go to the attacker.

Students are easy targets because they keep checking emails about exams, fees, or results. If something looks important, they react fast without checking properly.

The consequences can be serious. You can lose access to your account, sometimes even money. Personal data can also be misused. In some cases, the hacked account is used to send the same kind of messages to other people.

---

3. Prevention Checklist: Stay Safe Online

Some basic things that can help avoid these situations:

- Don't click on random links, especially if the message sounds urgent
- Always check who sent the email before trusting it
- Use strong passwords and don't use the same one everywhere
- Turn on extra security like OTP or two-factor login
- Avoid using public Wi-Fi for important work
- Don't share OTPs, passwords, or personal details with anyone

For UPI / money safety:

- Don’t approve UPI requests unless you are sure what it is for
- Don’t scan unknown QR codes or trust random payment messages

If something goes wrong:

- Report it on cybercrime.gov.in
- Call 1930

---

4. Conclusion

Phishing is quite common now, and honestly anyone can fall for it. Most of the time, it happens because people react quickly without checking.

So it’s better to slow down a bit and verify things before clicking anything. Even small precautions can make a big difference.

---

5. Personal Reflection

While working on this, the main thing that surprised me was how simple phishing actually is. I always thought hacking was something complicated, but here it’s more about fooling people than anything else. A normal-looking email can be enough if it creates urgency.

One habit I will change is clicking on links without thinking much. Earlier, if something looked important, I would open it immediately. Now I feel it’s better to pause and check first. Even taking a few seconds can help avoid problems later.
